

Take your enterprise to the next level with Google Chrome Enterprise

Companies are rapidly moving to the cloud. The rise in SaaS adoption has brought with it a new breed of worker—the cloud worker—someone who is productive from any location, on any device, accessing business apps via the cloud, and spending 3+ hours a day in their browser.

Legacy endpoints, which require a high degree of IT maintenance for provisioning and continued management, are not able to effectively support businesses as they migrate to the cloud nor empower cloud workers. Instead, organizations need endpoints that will:

Deliver **secure and consistent** access across mobile, SaaS and legacy apps

Protect against **ever-evolving threats**, including phishing and malware

Give IT **more control**, freeing up resources from basic administration and manual patching

The average employee now uses **22 cloud-based apps** and 3 devices as part of their job¹, and **94%** work while commuting or at home².

Connect your employees to the cloud with Acer and Chrome Enterprise

Acer's two new enterprise-class Chromebooks, the Acer Chromebook Spin 13 and Acer Chromebook 13 have been designed to optimize a cloud worker's performance—providing the speed, power and flexibility that they need to get more done, wherever they choose to work.

The Acer Chromebook 13 and Chromebook Spin 13 work as fast as you do.
