

Drive your on-premises workloads to the checkered flag, fueled by vSphere+

Accelerate your cloud transformation without disrupting business-critical apps

Enterprises prefer running many of their workloads in traditional, on-premises data centers due to better economics, latency-sensitivity, data privacy or sovereignty, regulatory compliance and the technical complexities of refactoring and migration.

These workloads can be enhanced by cloud services.

Managing Traditional and Next-Gen Workloads

Businesses need to empower their IT admins, Developer teams, and their Business decision makers to increase the horsepower of their environment and achieve victory.

» Infrastructure silos cause inability to deliver infrastructure for modern applications to DevOps or LOB

IT Admins

» Pressure to improve efficiencies to maintain and protect an increasingly complex and large environment

» Managing a multi-vCenter environment siloed across different geographies, edge locations, and clouds

Developers

» Significant amount of time spent on infrastructure operations related to networking and storage for Kubernetes deployments

Business Decision Makers

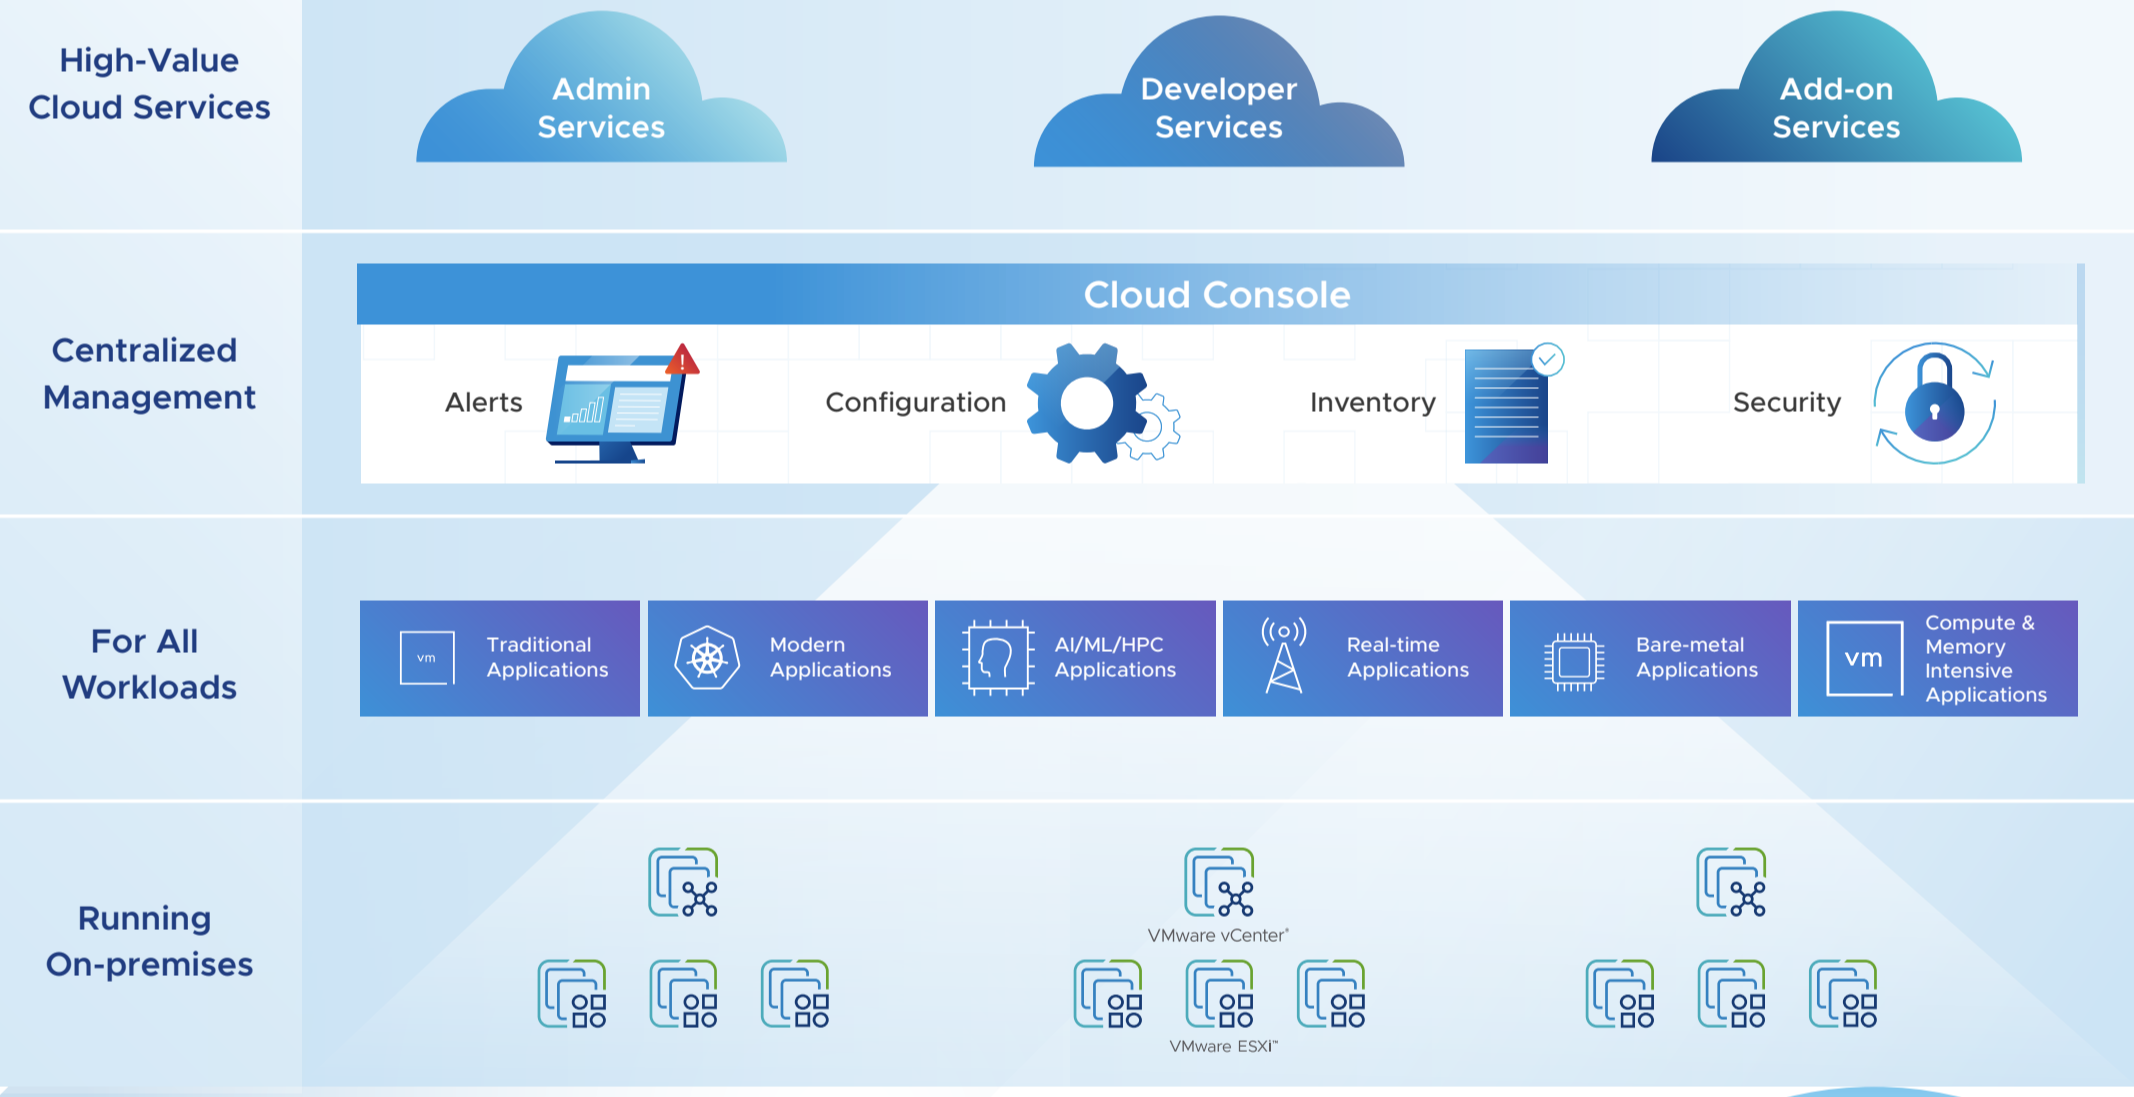

» Cloud benefits inaccessible to on-premises workloads

» A perpetual licensing model comes with complexities and constraints
