Plan your move to AWS with a Workload Migration Assessment

aws PARTNER Premier Tier Services

A Workload Migration Assessment (WMA) shows you exactly what's in your environment today and what it would cost to run it on AWS.

Signs it's time to look at the cloud

Running on legacy infrastructure costs more every year, and the pressure is coming from several directions at once:

- A software or licensing renewal is on the horizon, and you want to know your options before you sign
- A hardware refresh is forcing the question of whether to reinvest on-premises or move to the cloud
- A data center exit is on the roadmap, and you need a clear path off existing infrastructure
- Modernization is on the agenda, and your team wants room to build without legacy constraints
- Costs keep climbing, and you need a real number on what the cloud could save you

Meanwhile, teams already on AWS are tapping into AI, machine learning and advanced analytics to build capabilities their old environments could never support. A WMA can help you make the right call.

What you get

A WMA gives you a complete picture of your environment and what it would take to move to AWS.

Environment discovery: A full inventory of your servers, applications and dependencies

Workload analysis: See how your systems are really being used and where you can right-size

Total Cost of Ownership (TCO) summary: What AWS will cost compared to what you're paying now

Licensing review: Find where you can reduce or reuse existing licenses, handled by experts so your team doesn't have to learn the rules

Migration roadmap: Clear next steps to plan and prioritize the move

Meanwhile, teams already on AWS are tapping into AI, machine learning and advanced analytics to build capabilities their old environments could never support. A WMA can help you make the right call.

TD SYNNEX | aws

The WMA process

01 Discover
Data collection and inventory

02 Analyze
TCO and licensing review

03 Next Steps
Migration plan and roadmap

Fully subsidized

AWS funds the tools, licensing and delivery. You get the full assessment at no cost and keep your budget free until you're ready to act.

What happens next

The assessment wraps with a review of the findings, so you understand exactly what's in your environment and what your options are. From there, you decide what's next:

1 Build
a full migration plan

2 Prioritize
the workloads with the most upside

3 Run
a proof of concept on one application
